2. OpenClaw and WhatsApp Plugin Application

2. OpenClaw and WhatsApp Plugin Application
    Preparations Before Use
    1. Configure Bot
    2. Interact with Bot

Preparations Before Use

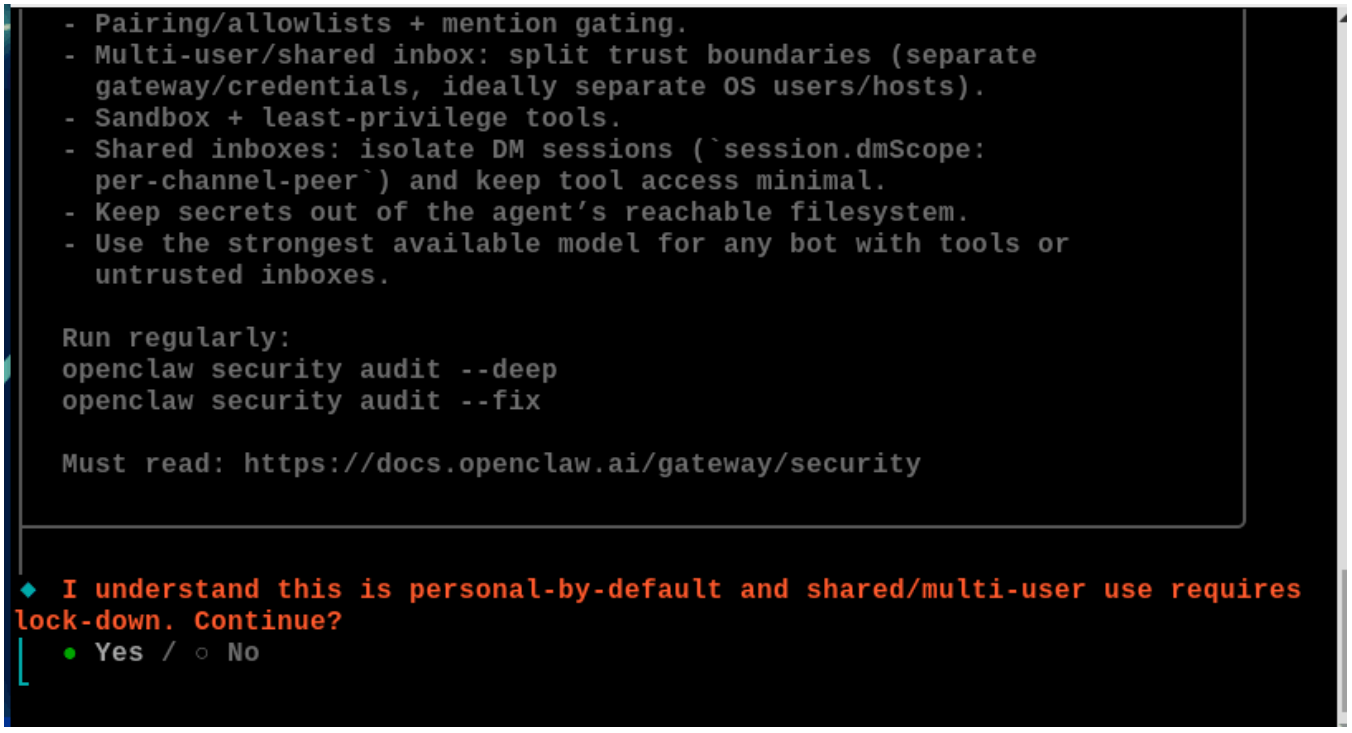

Important: confirm that OpenClaw is configured and responds normally.

If the bot does not respond normally, the following steps will not work.

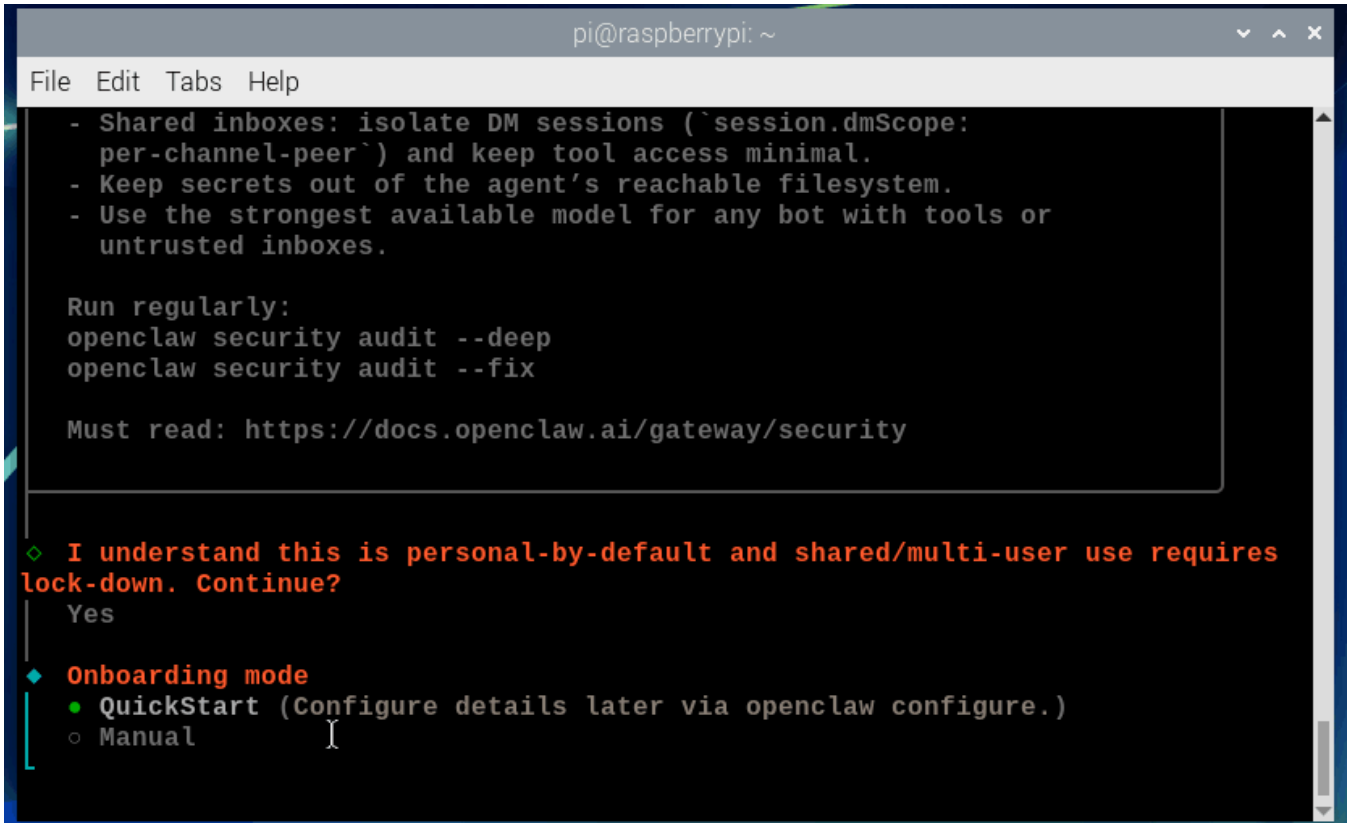

1. Configure Bot

Enter configuration mode

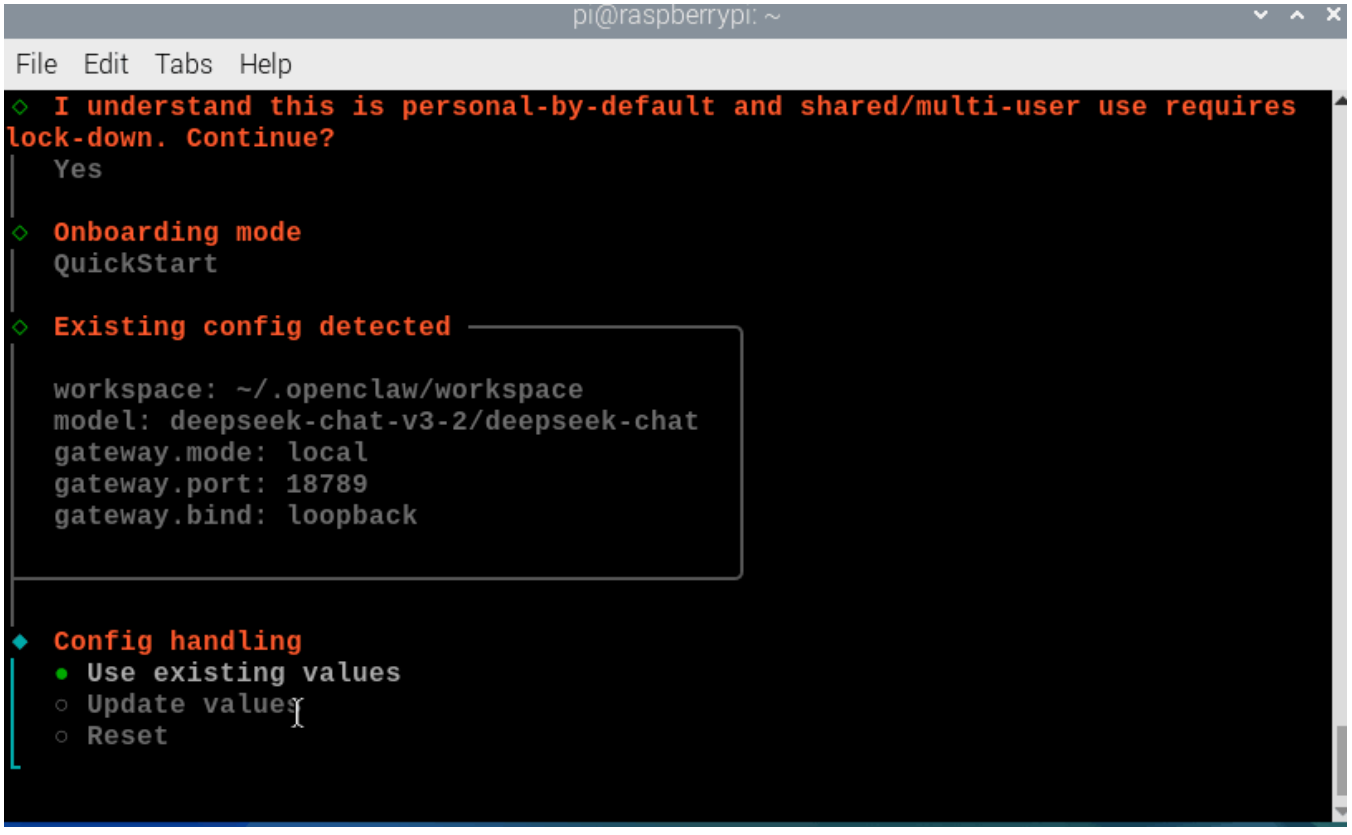

```
openclaw onboard  --install-daemon
```

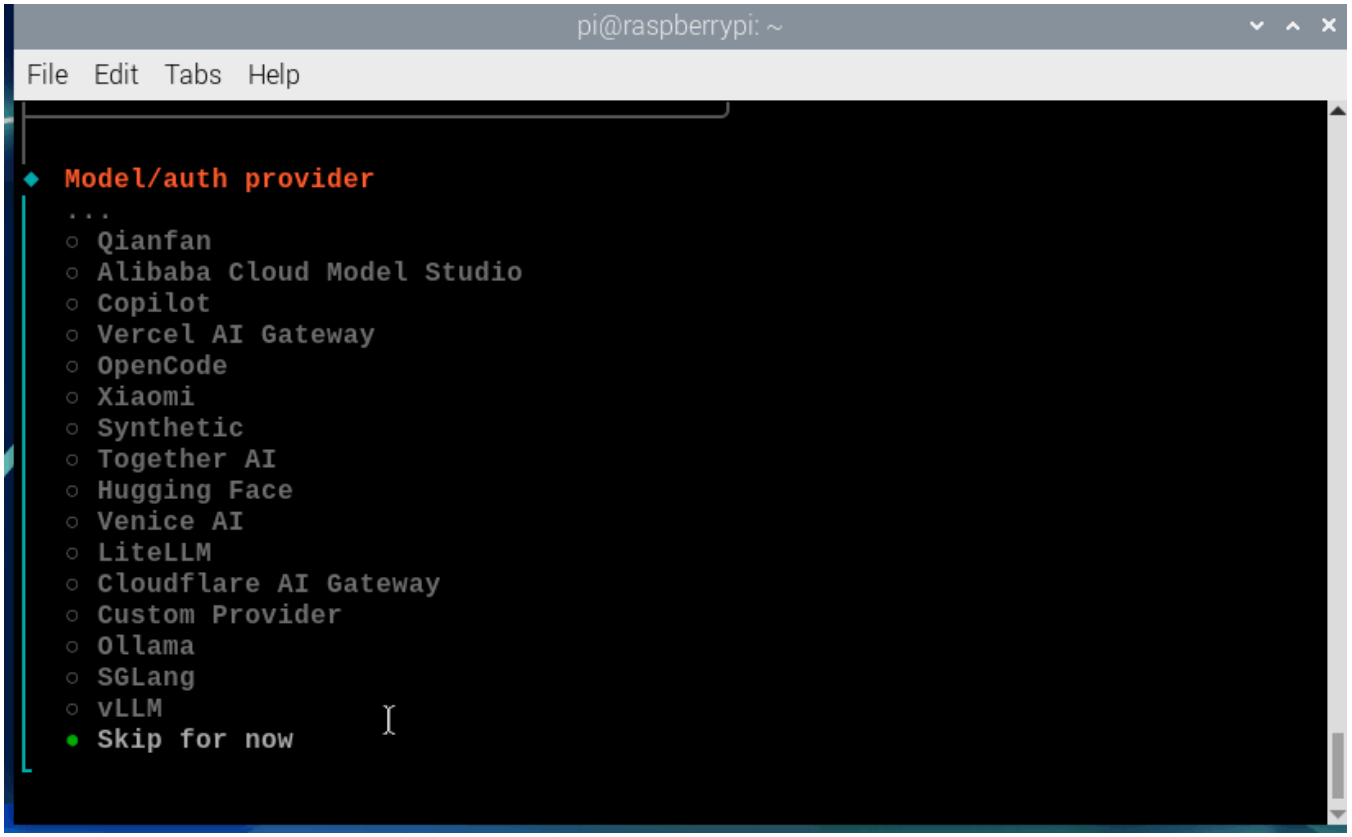

Select QuickStart

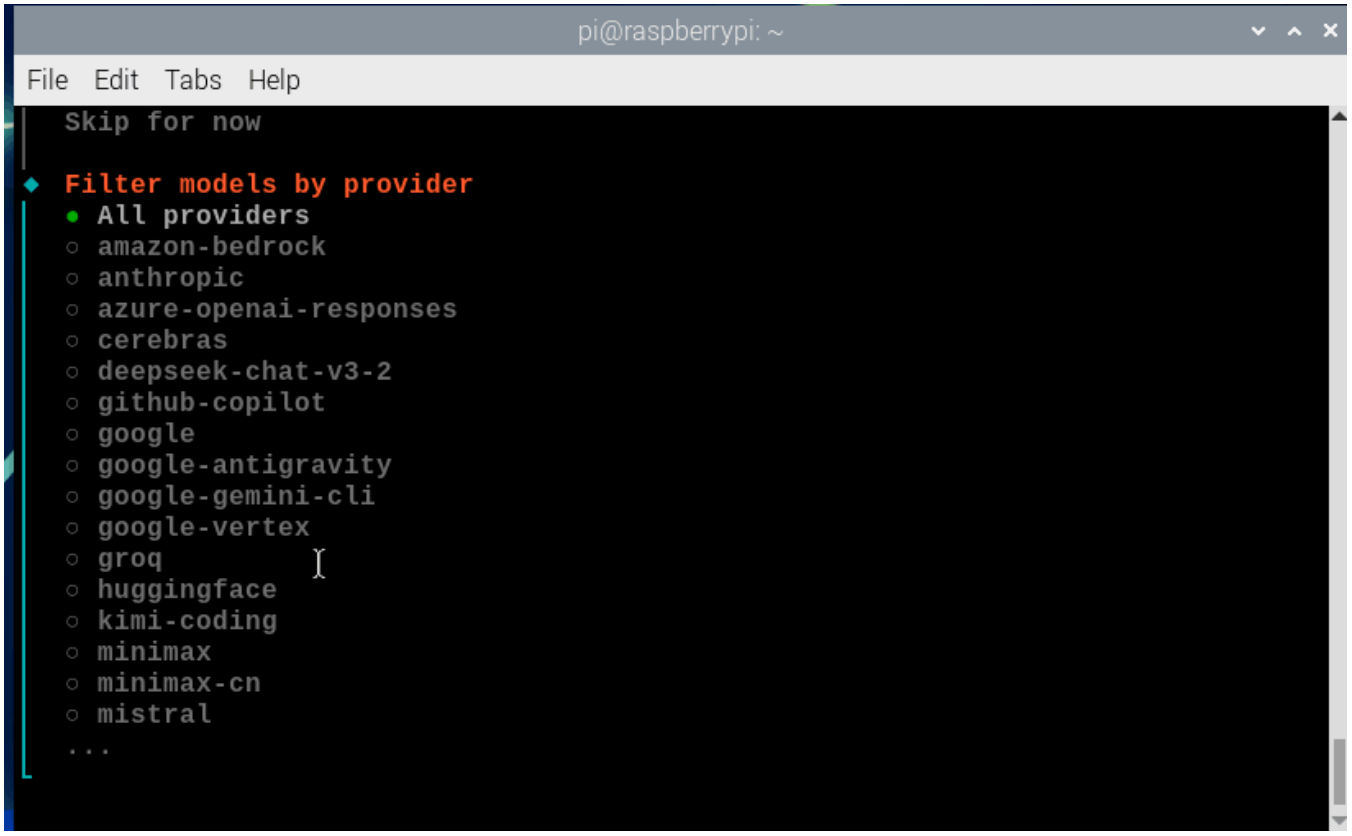

Select Use existing values

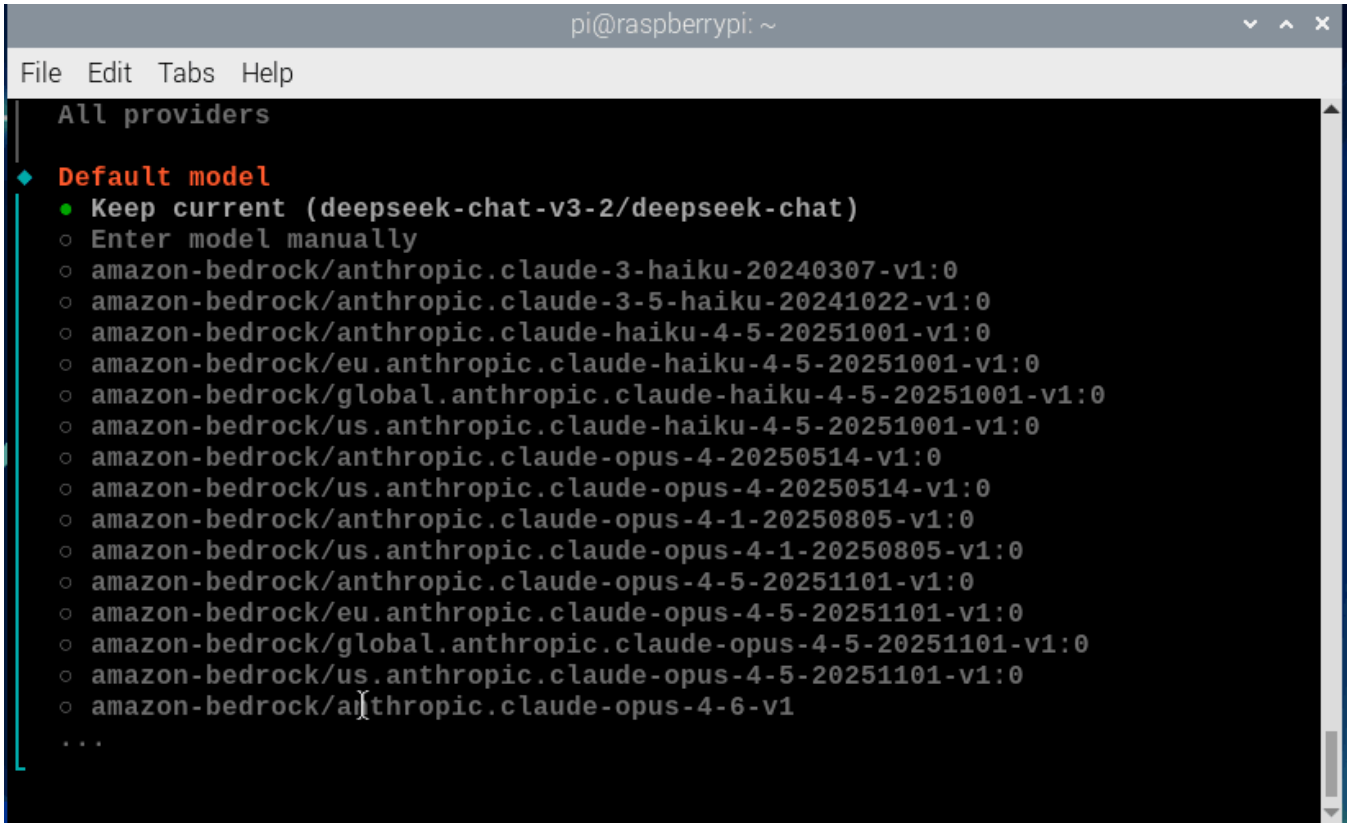

Select Skip for now

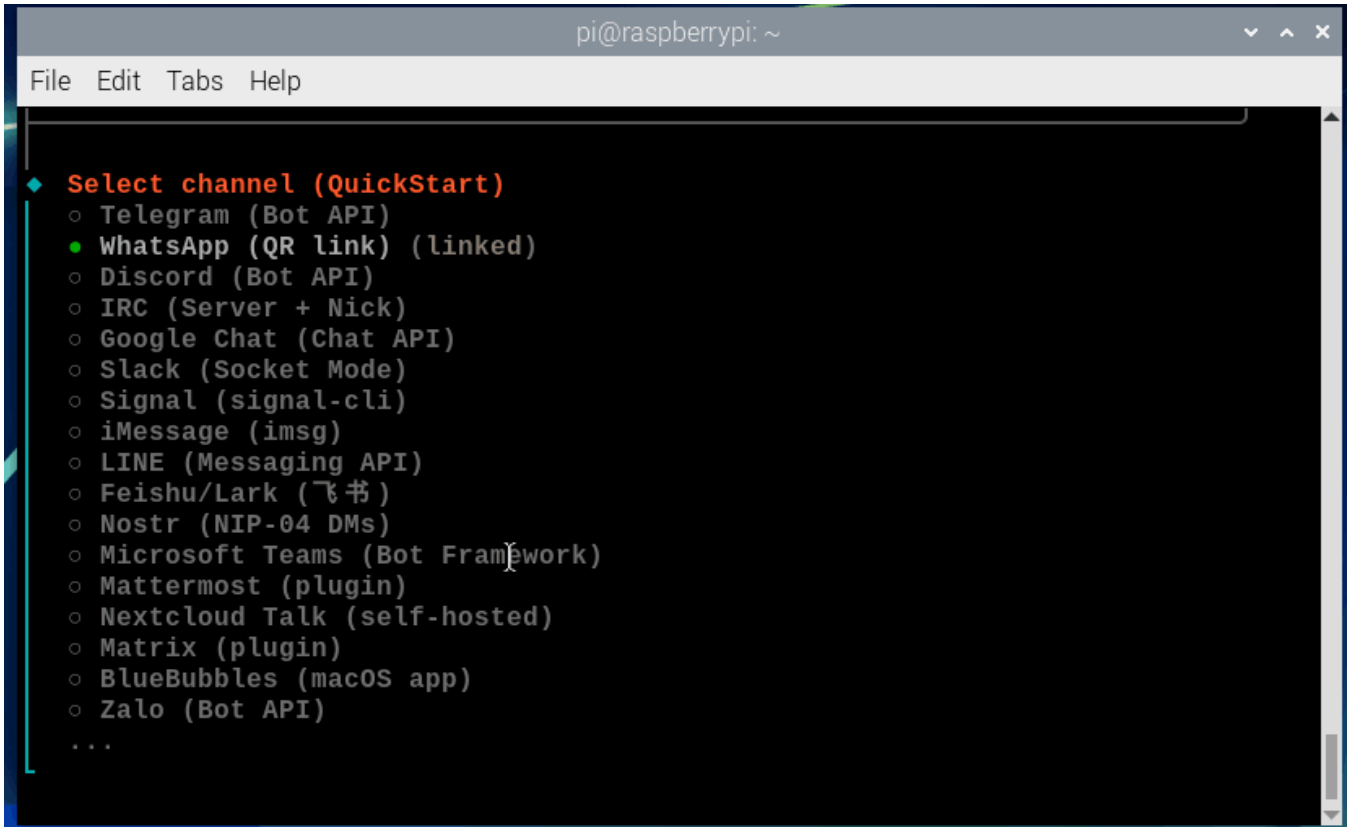

Select All providers

Select Keep current. Note: The content in parentheses is the model you configured yourself

Select WhatsApp (QR link)

> **Note: If you encounter a "Failed to install" error at this stage, it is most likely caused by an incompatibility between the older OpenClaw core and the newer WhatsApp plugin. Please follow the instructions below to resolve this:**

```
# Remove the Tavily dependency symlink that triggers out-of-bounds scanning
```

```
p=~/.openclaw/npm/projects/openclaw-tavily-plugin-8ad843922d/node_modules/@openclaw/tavily-plugin/node_modules/openclaw
[ -L "$p" ] && rm "$p"

# Remove the WhatsApp plugin directory
rm -rf ~/.openclaw/npm/node_modules/@openclaw/whatsapp

# Add whatsapp to the original allowlist
openclaw config set plugins.allow '["board-control","feishu","openclaw-qqbot","openrouter","qqbot","whatsapp"]'

# Confirm the OpenClaw version
openclaw --version

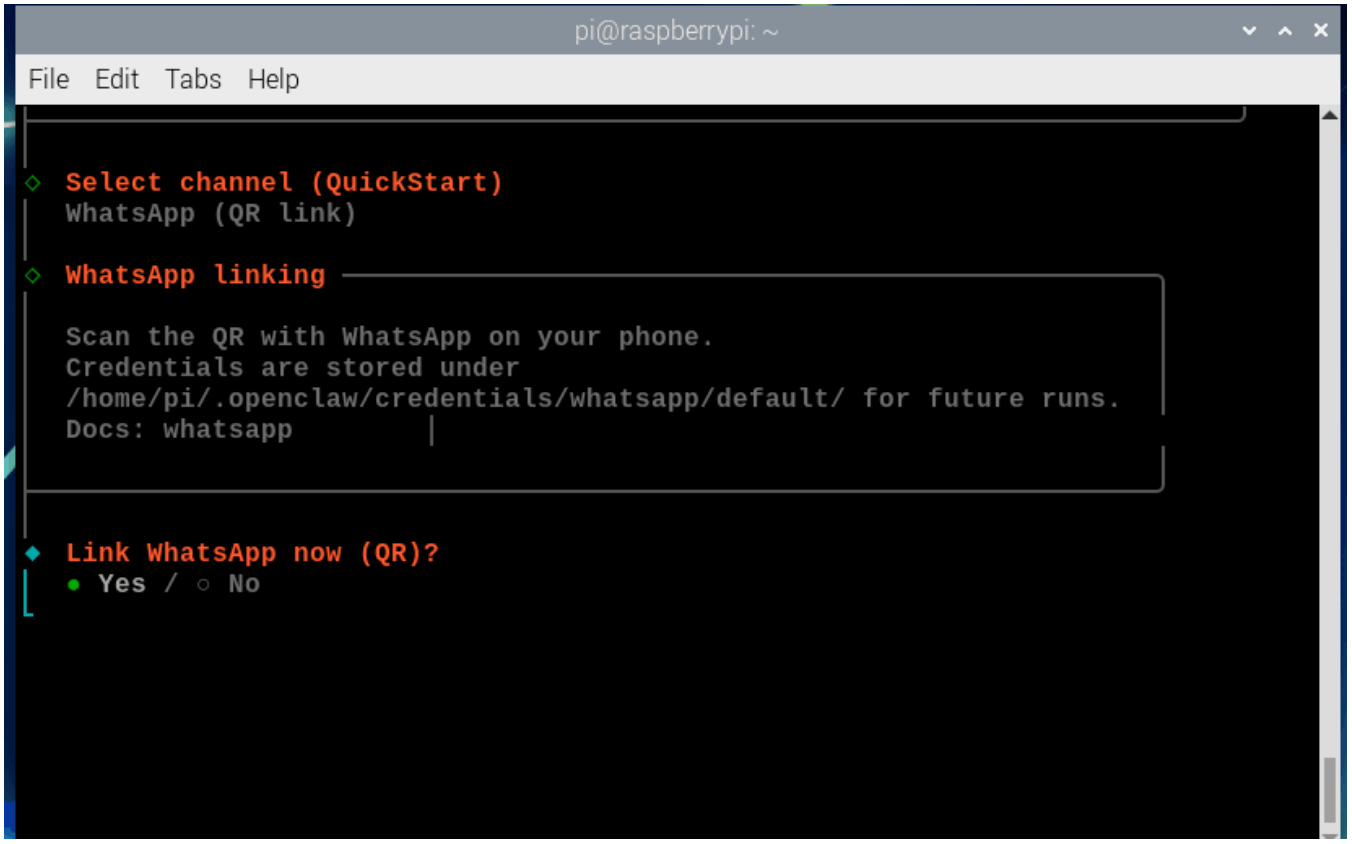

# Install the version compatible with OpenClaw
openclaw plugins install @openclaw/whatsapp@2026.5.7
openclaw gateway restart
openclaw onboard --install-daemon
```

If you prefer to use the latest version, you can also upgrade OpenClaw. Choose either of the two methods.

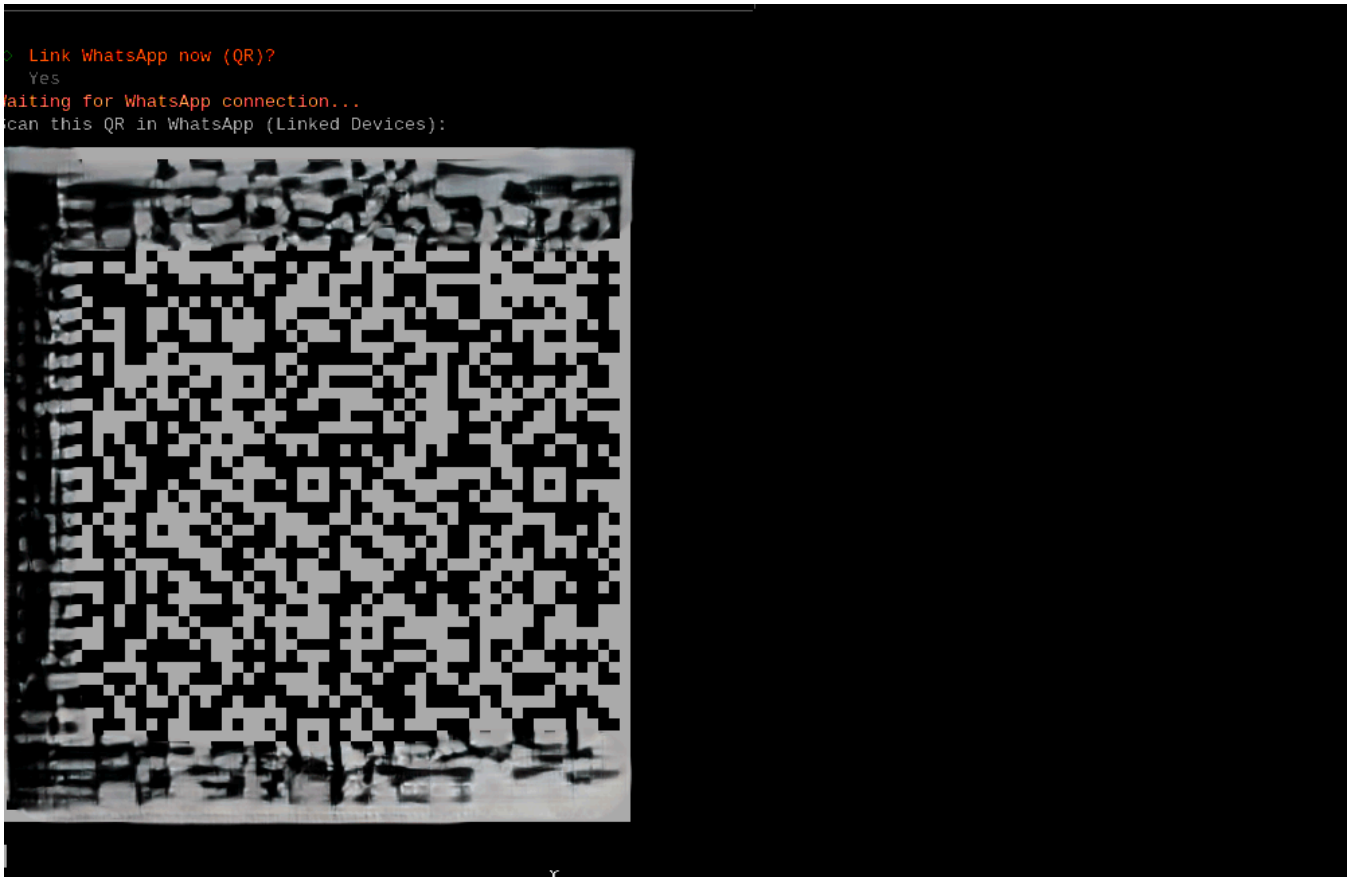

Once the instructions have been completed, run the following again:

```
openclaw onboard  --install-daemon
```

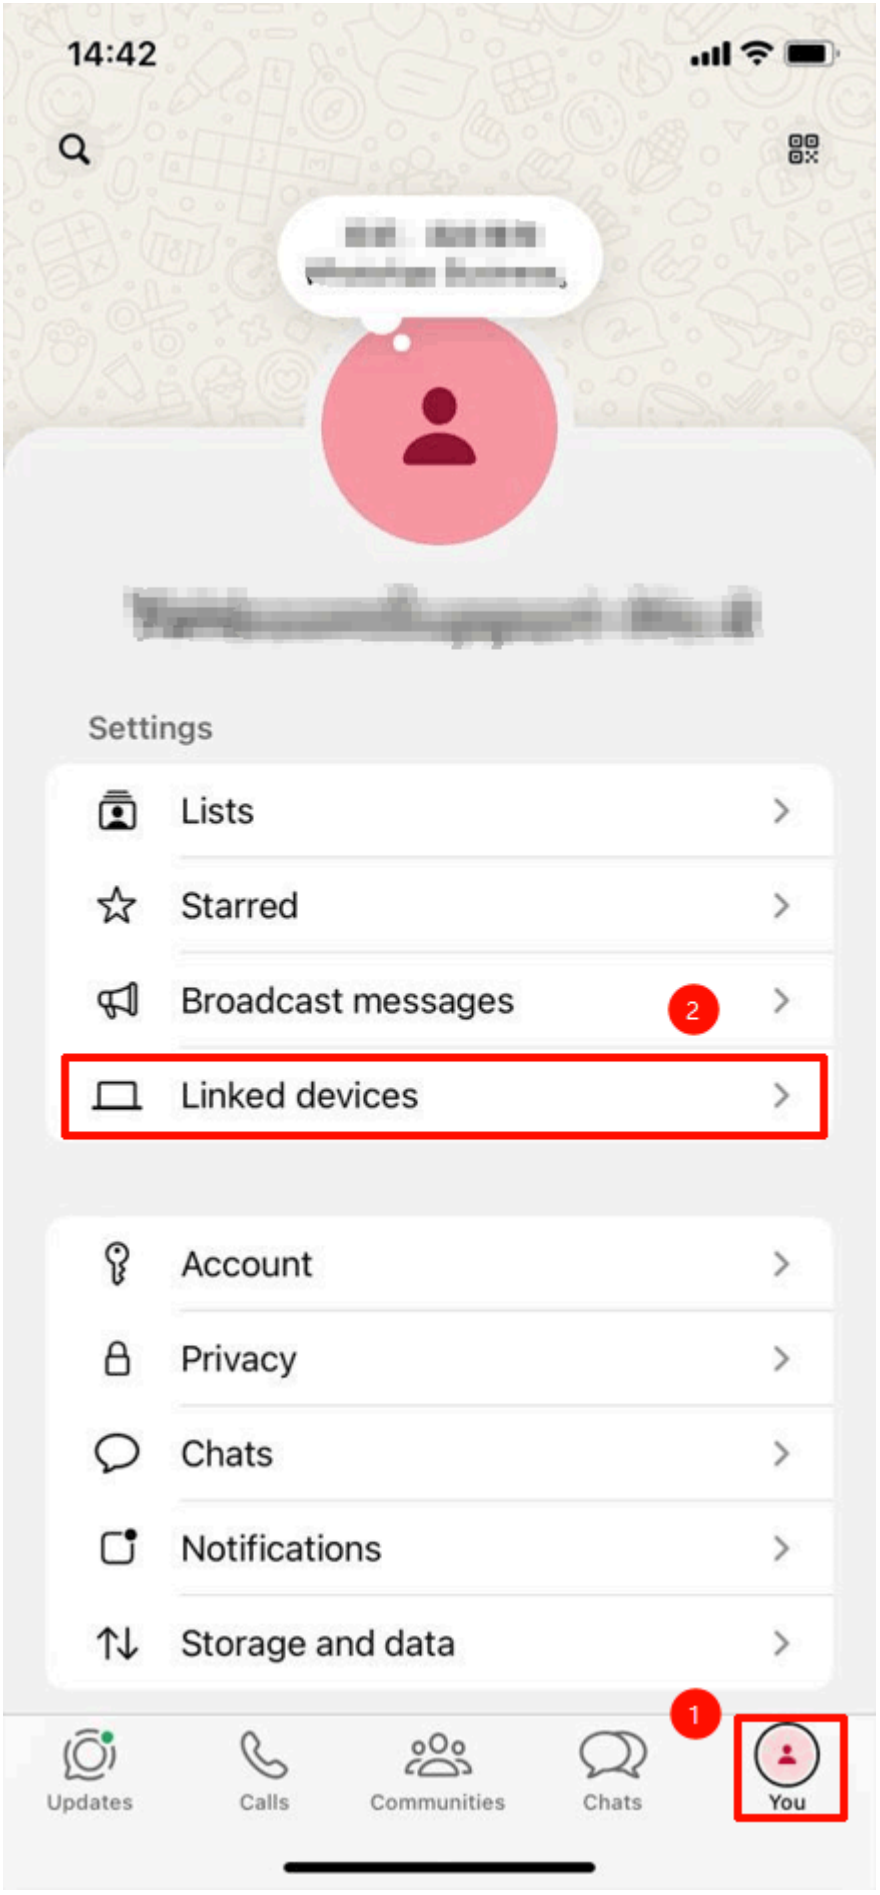

Select Link WhatsApp now (QR)

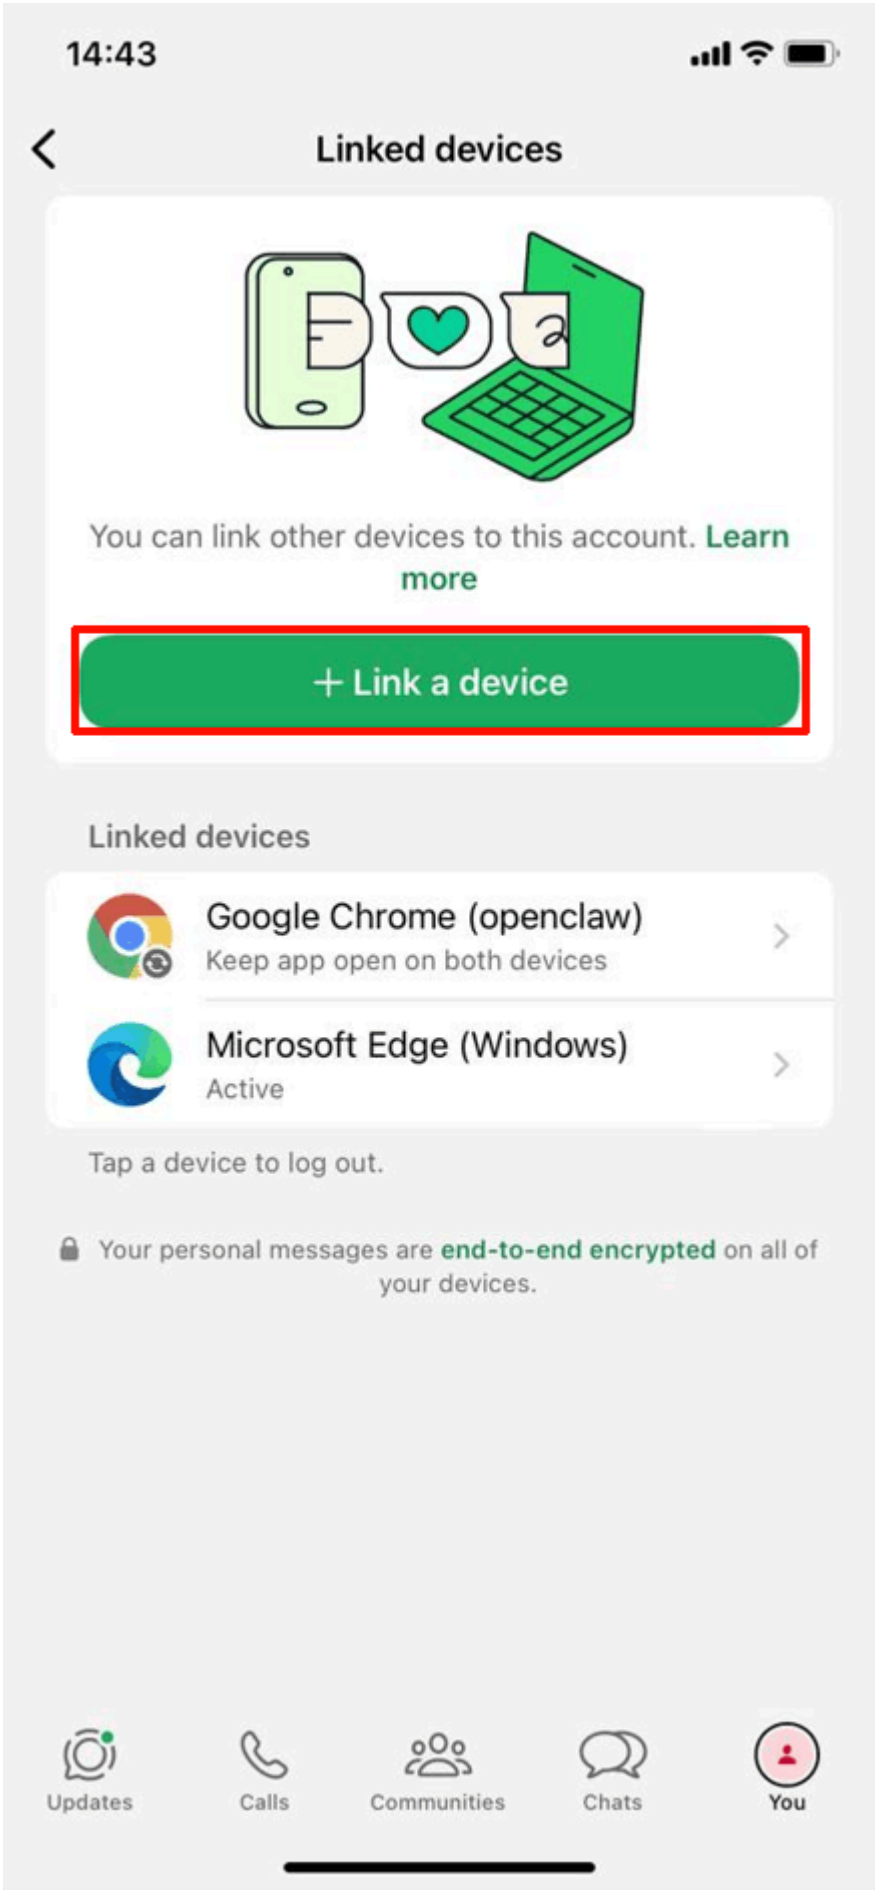

Then a connection QR code will appear

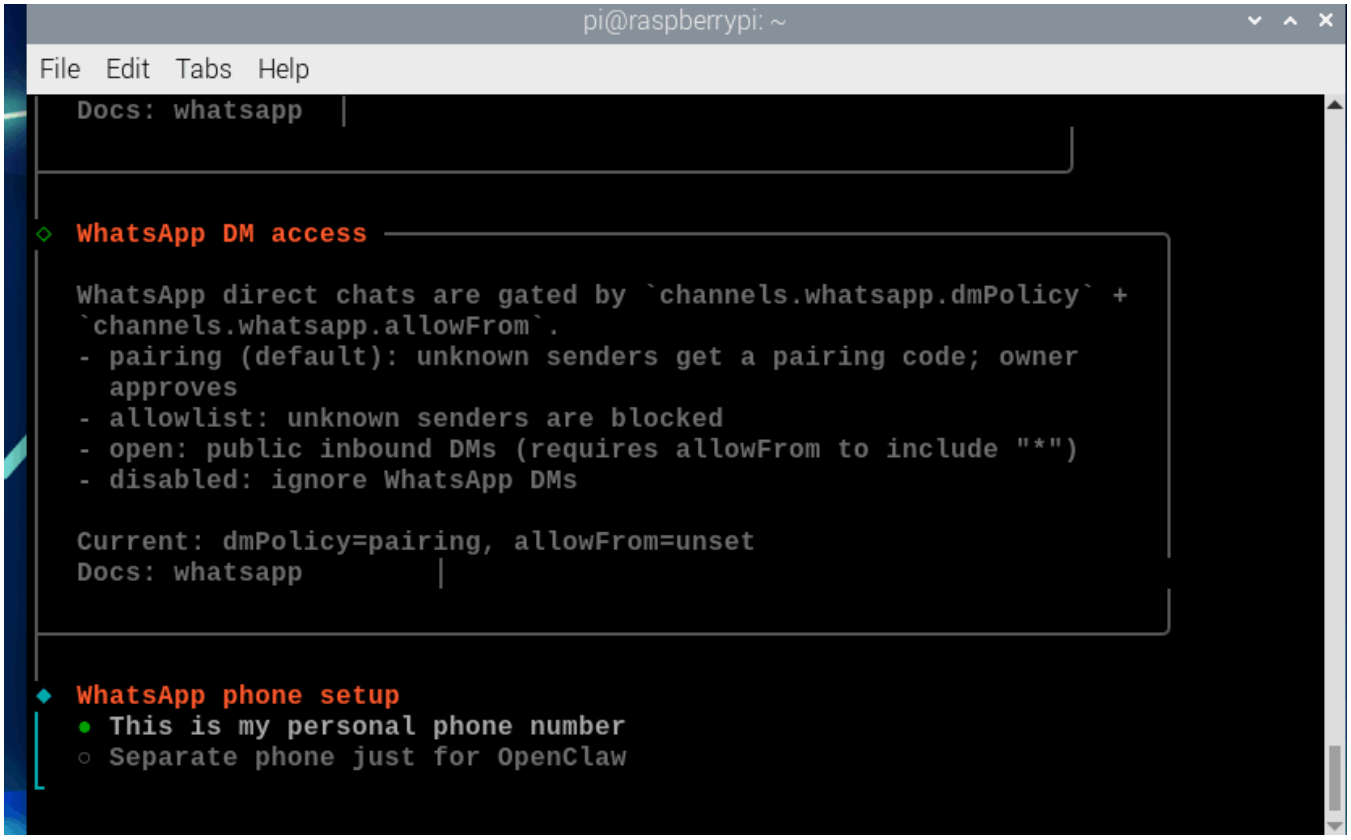

Open WhatsApp on your phone, click You ---- Linked devices

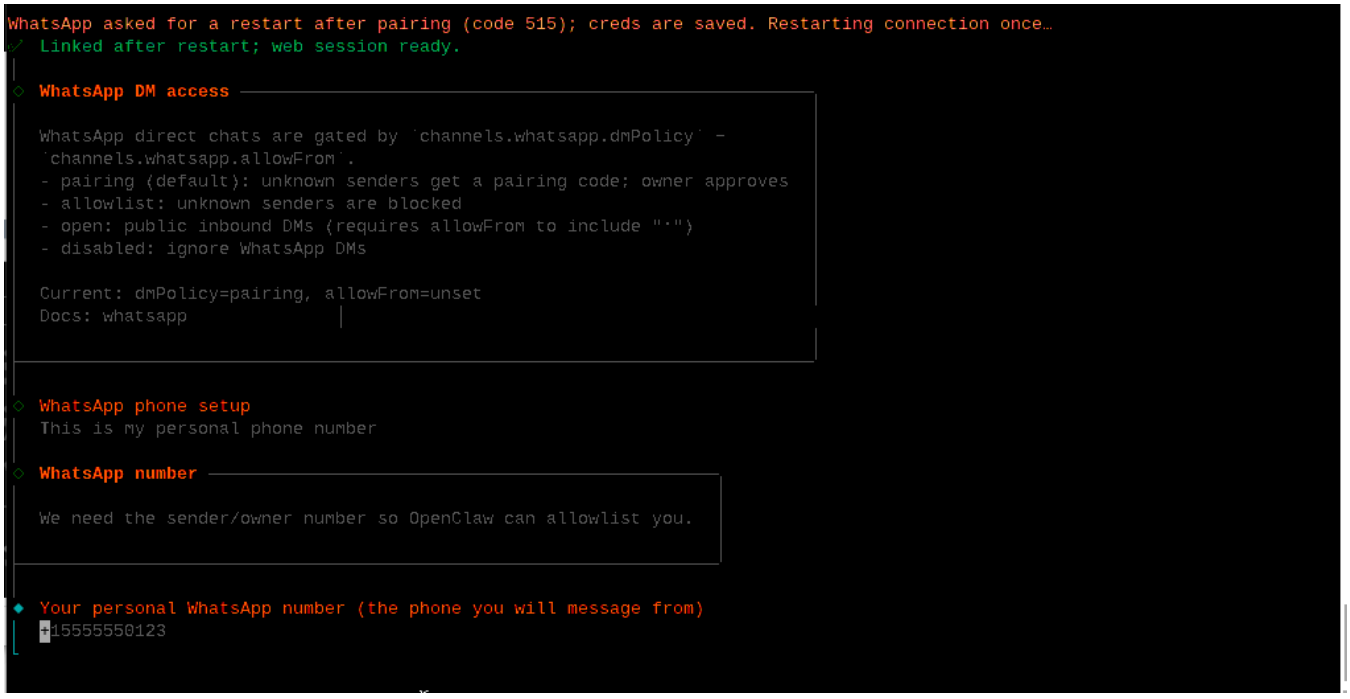

Click Link a device, then scan the OpenClaw QR code

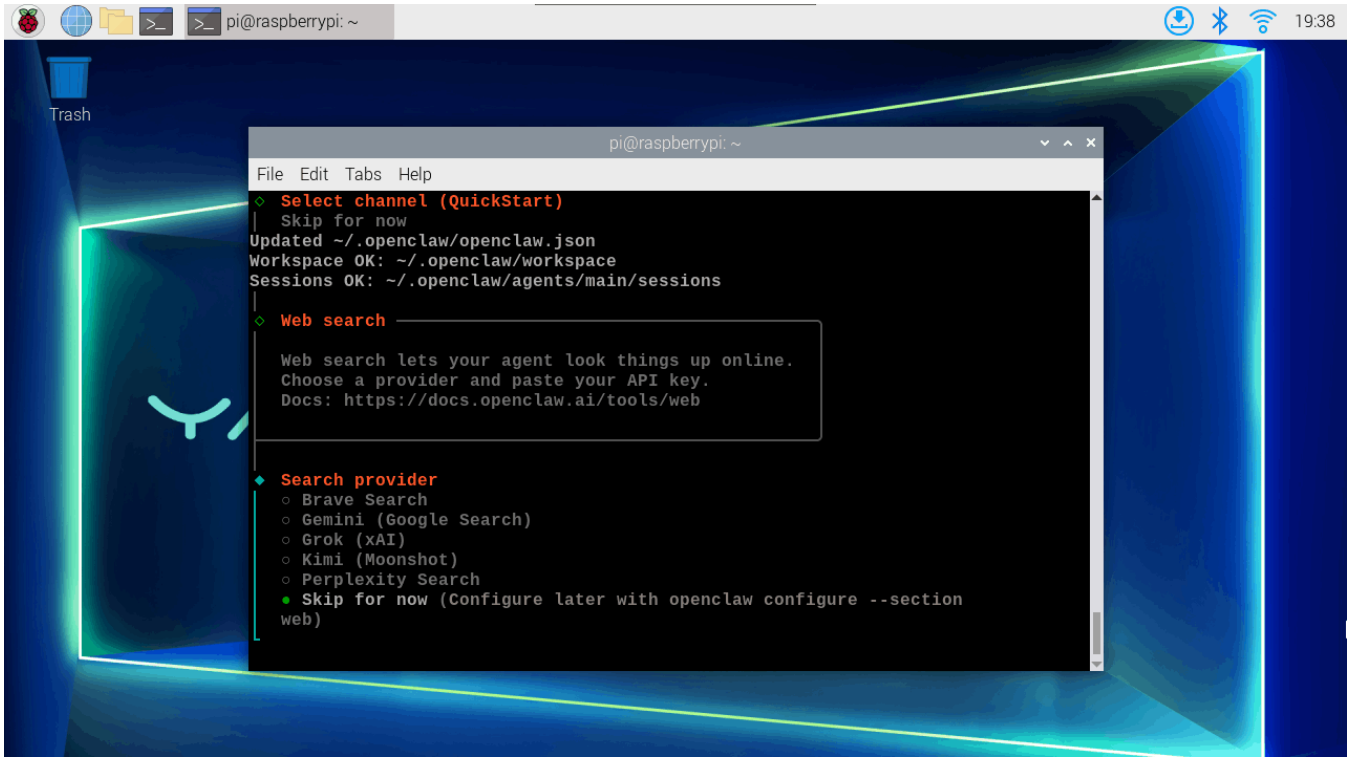

After scanning, wait for the connection to succeed. After successful connection, the following figure appears, select This Is my personal phone number

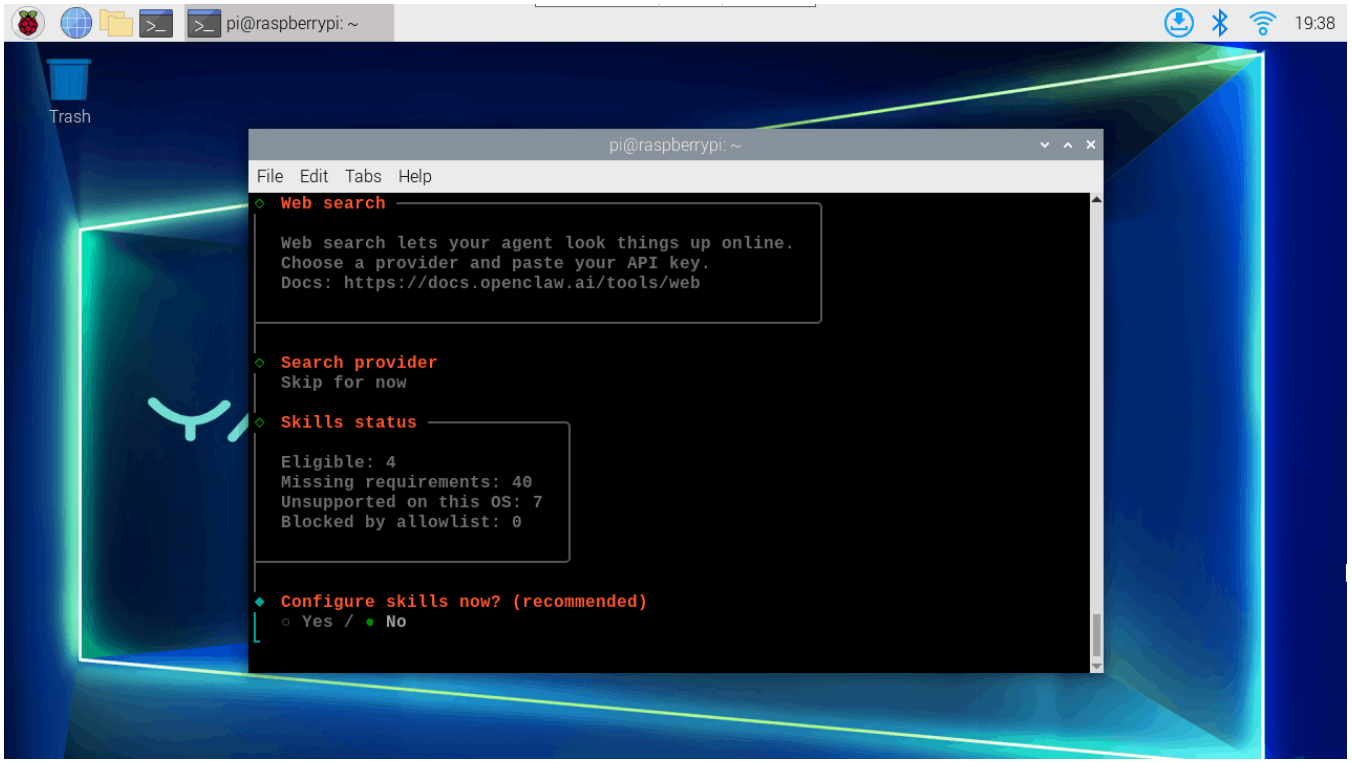

Enter your phone number, which needs to include the country code

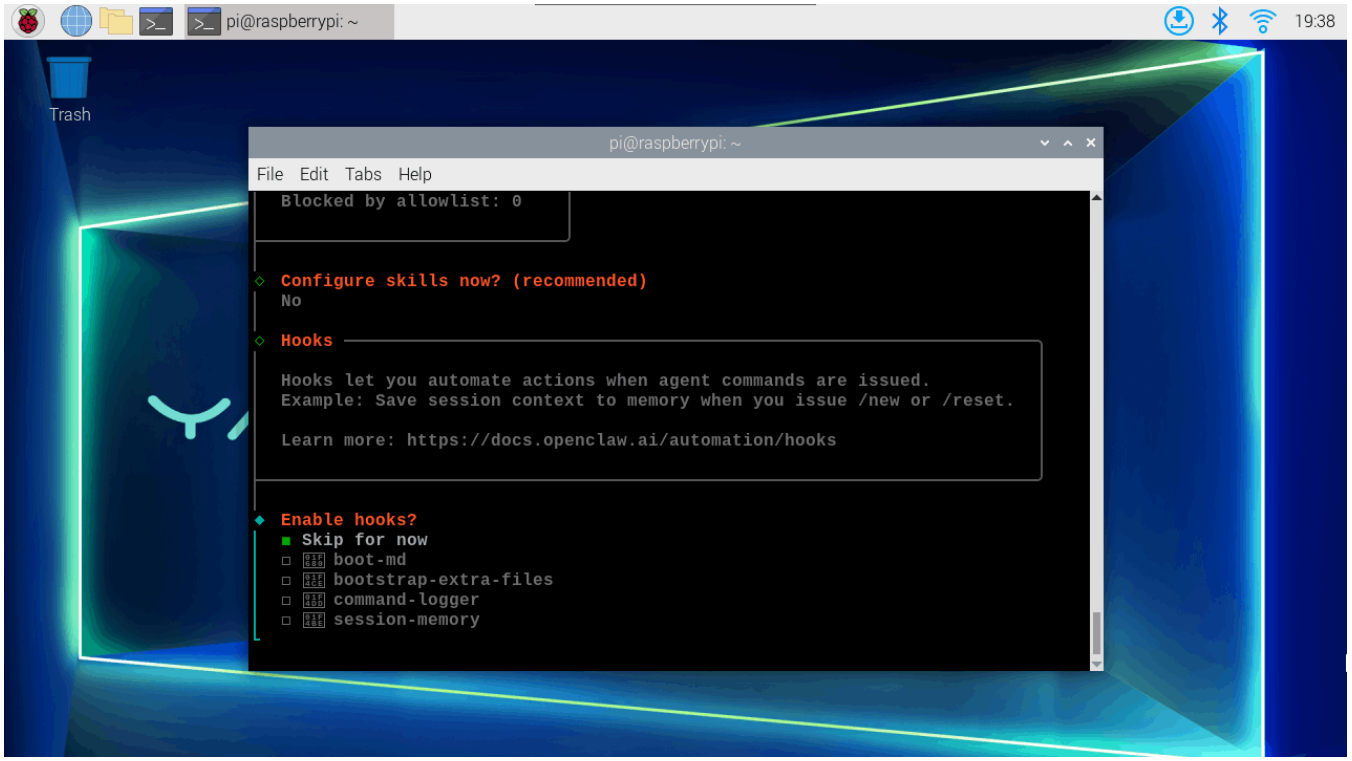

Skip Search provider

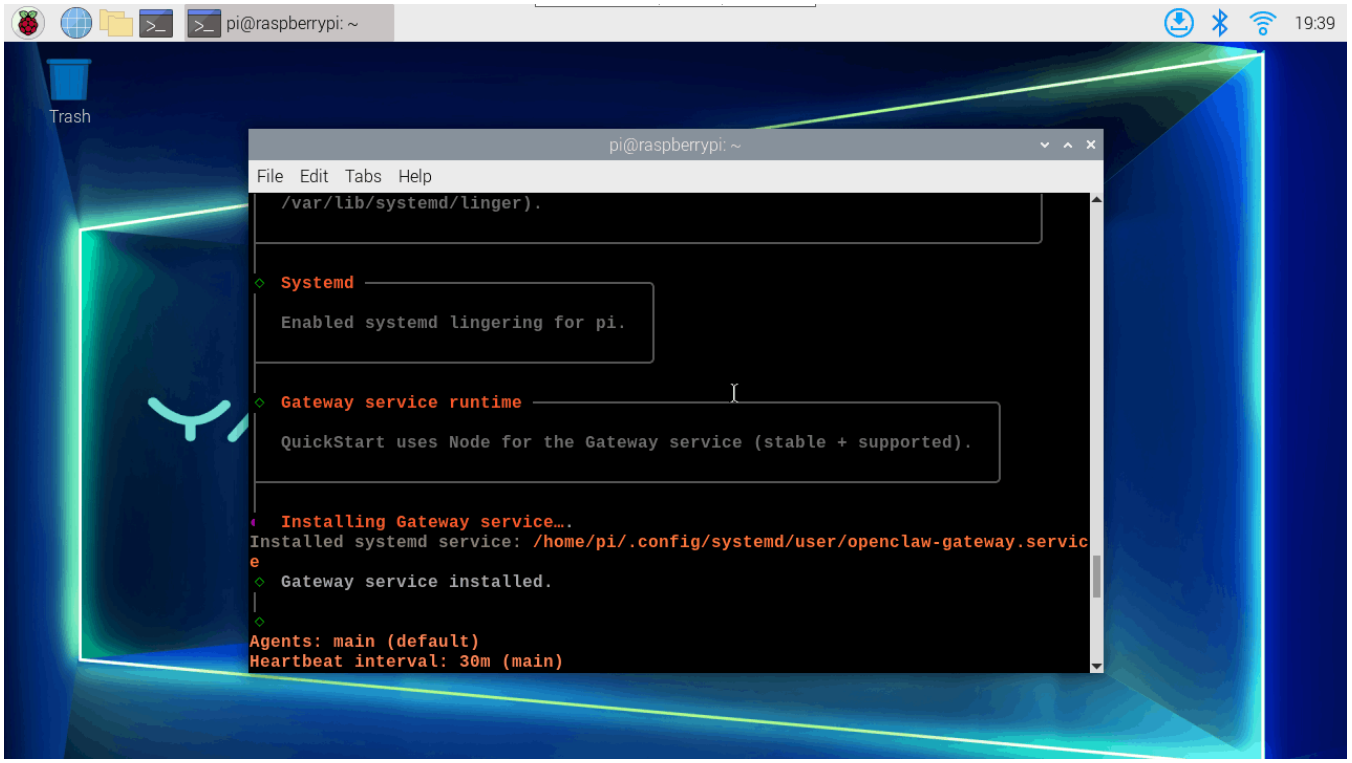

Also skip Skills, install them later as needed

Also skip hooks, select Skip for now, then press space to select, then press Enter

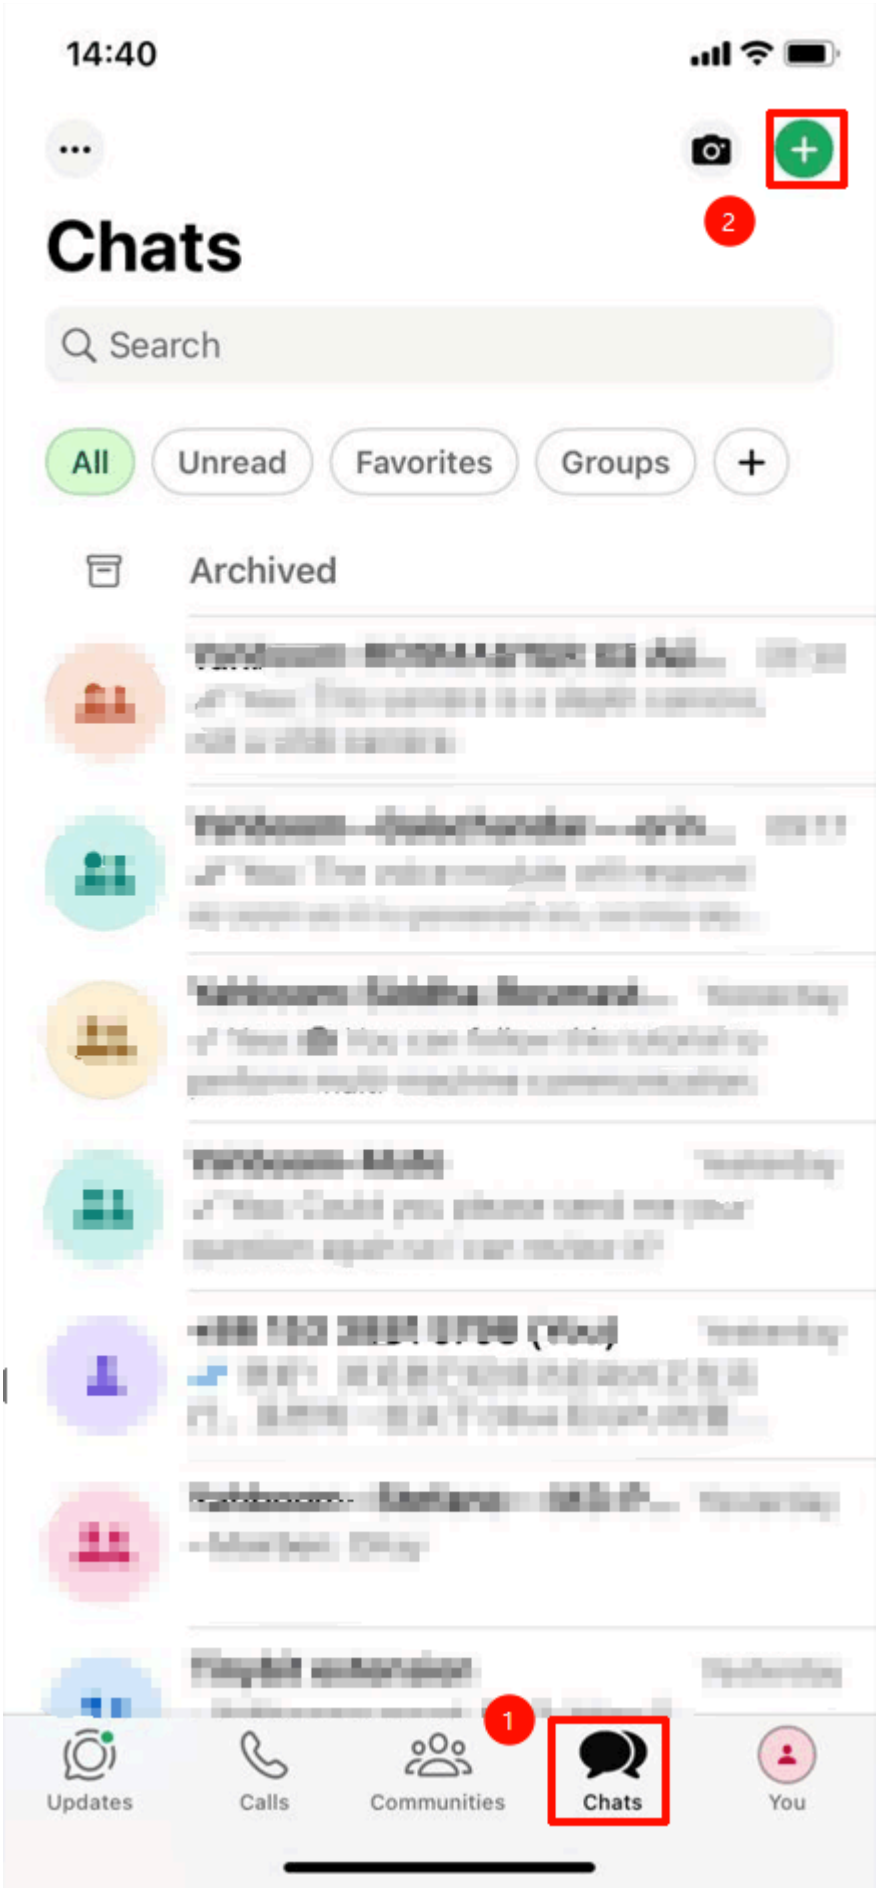

Select restart gateway.

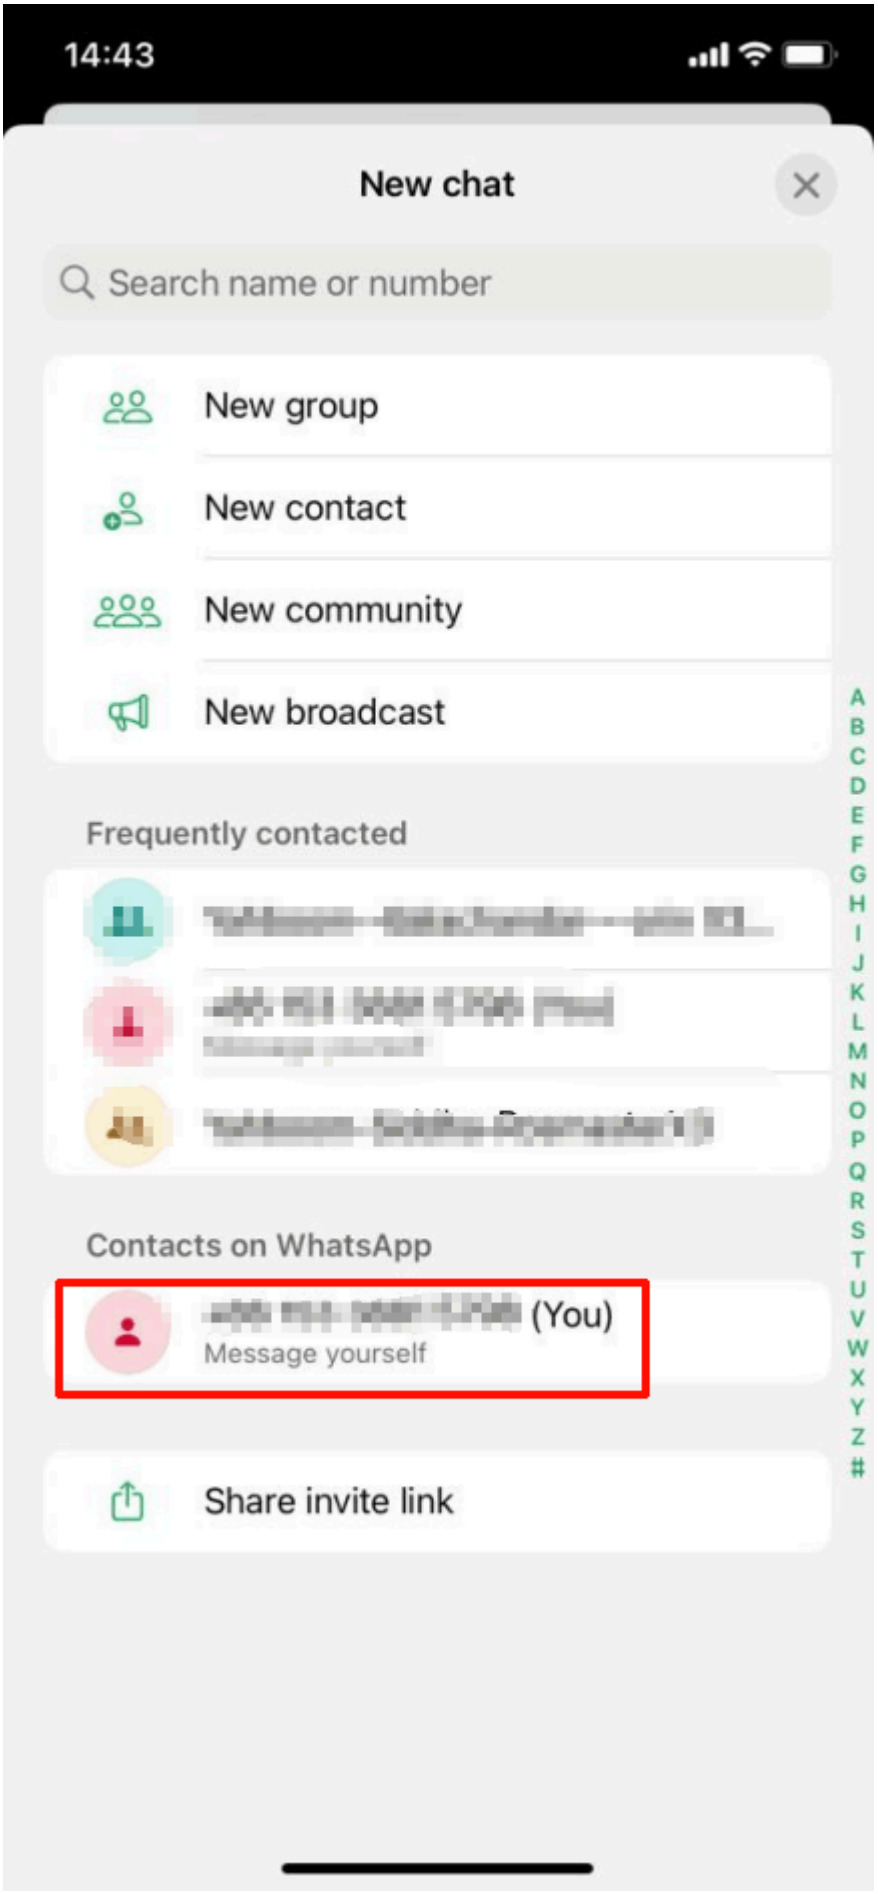

You can choose TUI interaction interface or Do this later.

2. Interact with Bot

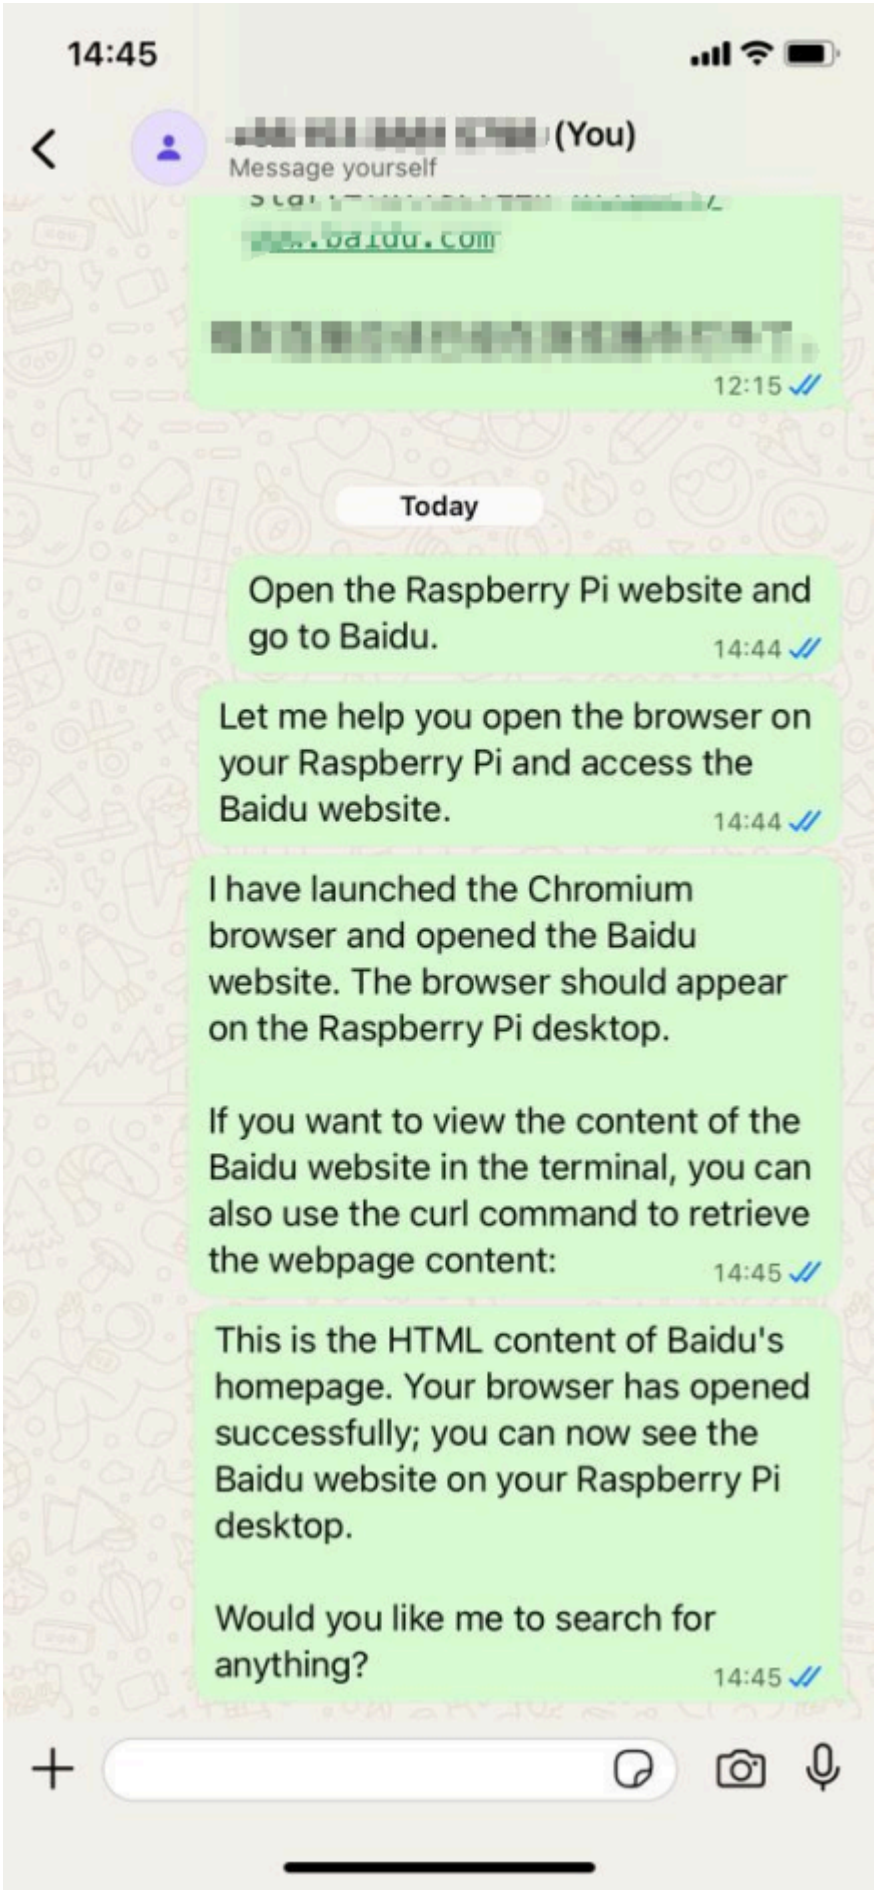

Open WhatsApp, click Chat ---- "+"

Click to send message to yourself

Just send the content you want to interact with.

Today
Open the Raspberry Pi website and go to Baidu.
14:44
Let me help you open the browser on your Raspberry Pi and access the Baidu website.
14:44
I have launched the Chromium browser and opened the Baidu website. The browser should appear on the Raspberry Pi desktop.
If you want to view the content of the Baidu website in the terminal, you can also use the curl command to retrieve the webpage content:
14:45
This is the HTML content of Baidu's homepage. Your browser has opened successfully; you can now see the Baidu website on your Raspberry Pi desktop.
Would you like me to search for anything?
