Docker installation

Docker installation

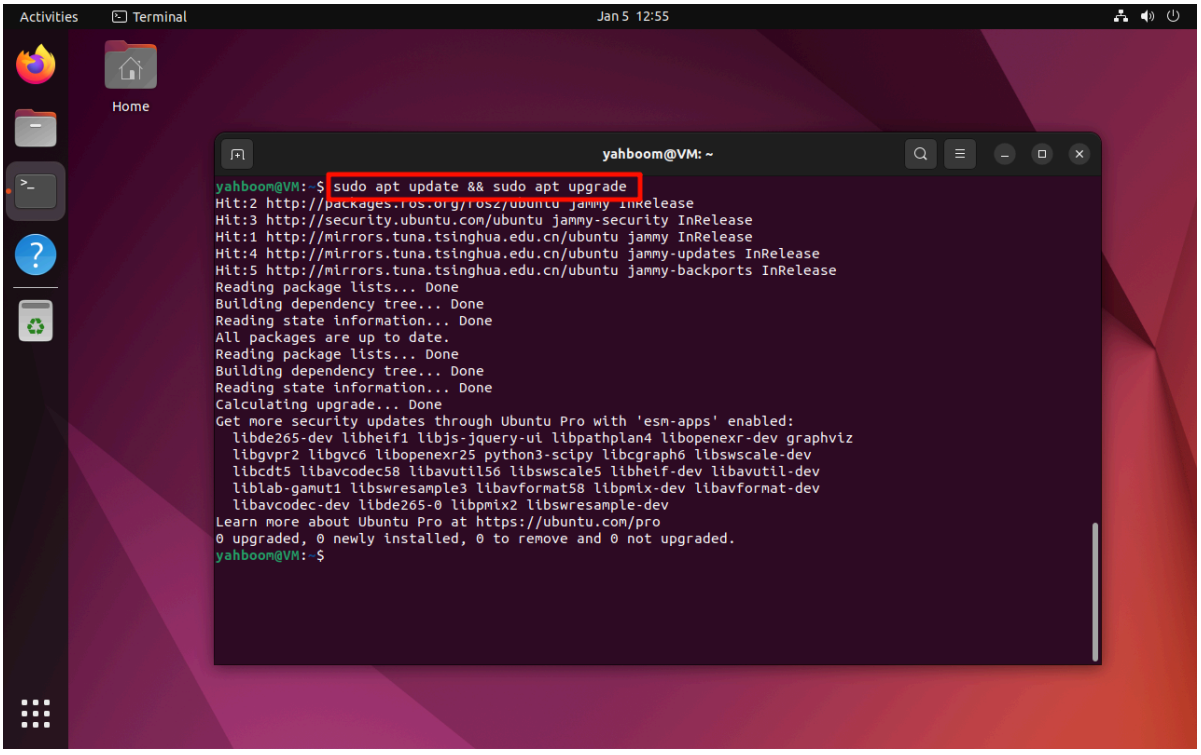

1. Update system software
2. Official script installation
    2.1. Install curl software
    2.2. Download script
    2.3. Run script
3. Add access permissions

This tutorial shows how to install Docker using the official script.

1. Update system software

Make sure the system package is up to date: If the system environment has version dependency issues, just update the software source list

```
sudo apt update && sudo apt upgrade
```

2. Official script installation

2.1. Install curl software

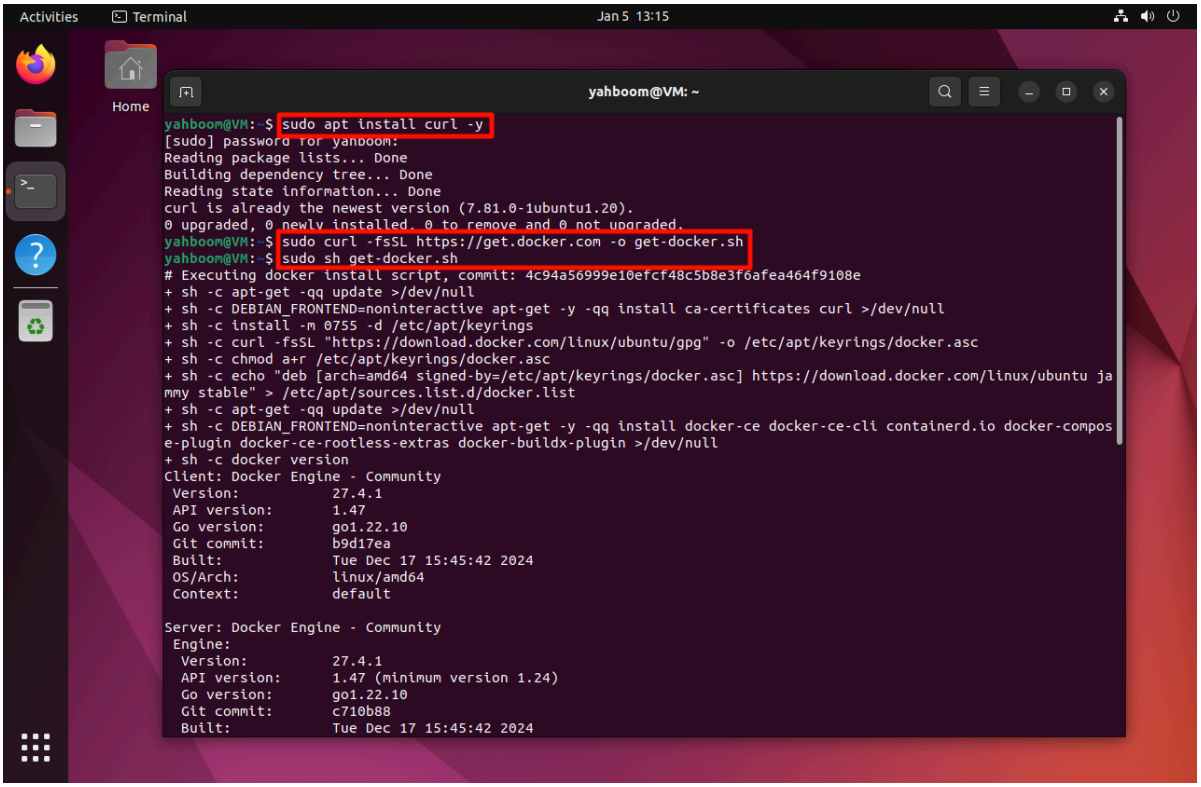

```
sudo apt install curl -y
```

2.2. Download script

```
sudo curl -fsSL https://get.docker.com -o get-docker.sh
```

2.3. Run script

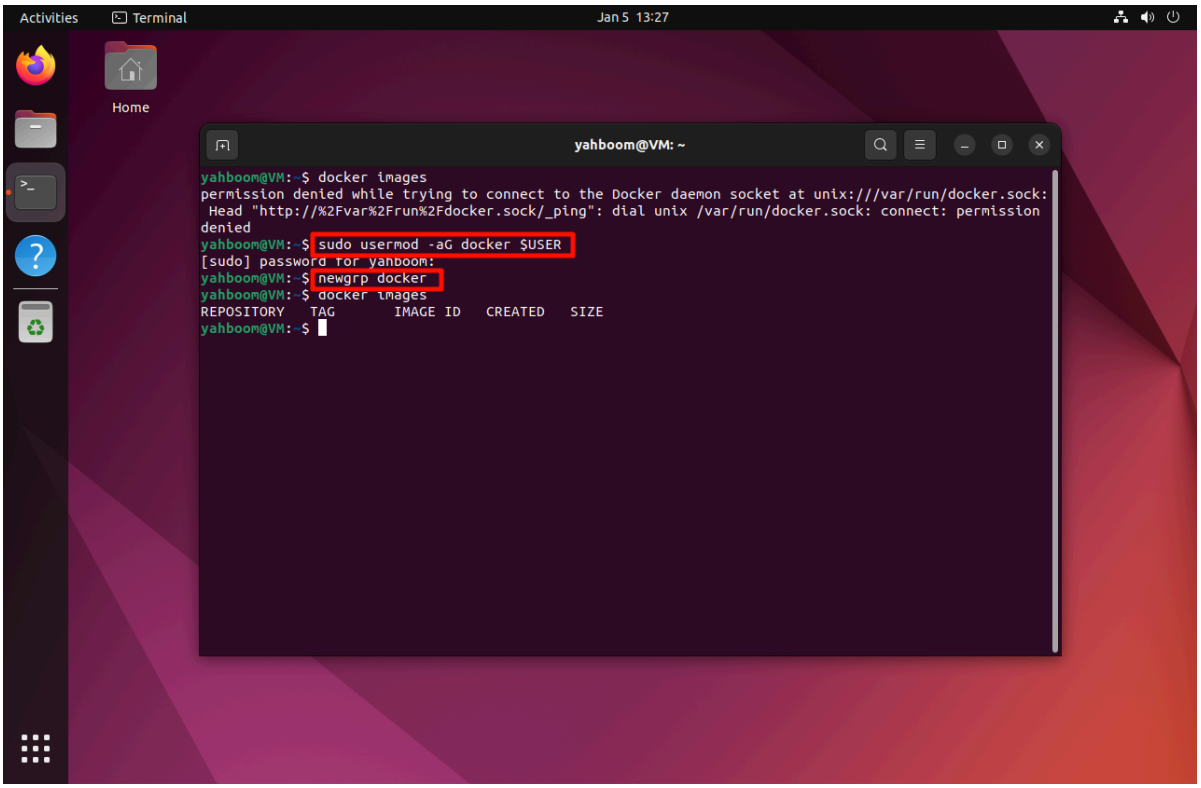

```
sudo sh get-docker.sh
```

3. Add access permissions

Grant the current user access to the Docker daemon so Docker commands work without sudo.

```
sudo usermod -aG docker $USER
newgrp docker
```
