Orin Nano Installation and Update Notes

Users who purchased after October 17, 2025 can skip this tutorial; customers who purchased before October 17, 2025 must pay special attention:

If you need to run the **upgrade** command or click the pop-up window to update the system, you must execute the following commands before running it, otherwise the system will not boot after the update.

```
sudo apt update
sudo apt install cpio
```

Run upgrade after running the above commands.

```
sudo apt upgrade
sudo apt-get upgrade
```

2. If you update the system using the desktop pop-up prompt, after clicking install, you need to run the following commands while the system has **not been shut down and restarted**; otherwise, the system will not boot after restarting.

```
sudo apt update
sudo apt install cpio
sudo apt upgrade
```

Solution to Boot Failure After System Update:

1. If you want to continue using our image, first refer to item ①, prepare a solid-state drive enclosure yourself, and re-write the solid-state image. If the system still fails to boot after re-writing the solid-state image, then refer to item ② and write the super bootloader. Finally, check whether the system boots.
2. If you do not use our image, you can refer to the following tutorial to write the official clean image. However, the clean image does not contain any environment, so our tutorials cannot be used directly.
